

Division War Facts

This is a variation of the classic game of war, but using division. It is **suitable** for scenarios where a **student plays with an adult** or **when the players have comparable levels** (the competition is fair, no player is likely to be discouraged).

<i>Players</i>	2 or more
<i>Skill</i>	Whole division with or without remainders.
<i>Card values</i>	Ace represents the number "1," Jack is "12," Queen is "14," King is "15," Joker is "16". Other cards stand for their face values (you might want to put a reminder of these values on the table).
<i>Objective</i>	Win the largest number of cards.
<i>Preparation</i>	Deal all the cards to the players. They form a stack, face down.
<i>How to play</i>	On a "ready, set, go!" count, each player turns over two cards (with 2 or 3 players) or one card (4 or more players). The first player who identifies a division fact with the cards on the table can take all the cards and put them under their stack of cards. A division fact is a set of three cards that form a division equation. For instance, a player sees a 10, 5 and a 2 and says: "10 divided by 5 equals 2!". If no player identifies a division, all players turn over new cards.
<i>End of game</i>	The game is finished once one of the players does not have any cards left. The player with the largest number of cards wins; this can take quite a long time with two players, so in this case, you might prefer not to enable players to reuse already won cards.
